Key Concepts

1. What is Ado Net?

Ado Net (Ado.NET) is a set of .NET Framework classes and interfaces that provide data access services. It allows developers to connect to and interact with data sources such as SQL Server, Oracle, MySQL, and more.

2. What are the benefits of using Ado Net?

- Provides a consistent and efficient way to access data
- Supports a wide range of data providers
- Offers high performance and scalability
- Facilitates data binding and data manipulation

3. What are the main components of Ado Net?

- Data Providers: Provide connectivity to specific data sources
- Connection: Represents the connection to a data source
- Command: Used to execute queries or stored procedures
- DataReader: Reads data from a data source
- DataSet: Represents a collection of data tables and allows for data manipulation

Best Practices

4. What are the best practices for using Ado Net?

- Use parameterized queries to prevent SQL injection attacks
- Dispose of connections and commands properly to release resources
- Use bulk operations for inserting or updating large amounts of data
- Optimize queries for performance

- Use transactions to ensure data integrity

5. How can you improve the performance of ADO.NET queries?

- Use indexes on the database tables
- Optimize the query by reducing the number of joins and subqueries
- Use batch operations instead of multiple round trips to the database
- Cache frequently used data

Common Scenarios

6. How would you handle a connection error in ADO.NET?

Use exception handling to detect and handle connection errors gracefully. Log the error details and provide meaningful error messages to the user.

7. How would you pass parameters to a stored procedure using ADO.NET?

1. Create a new SqlCommand object
2. Set the CommandType property to StoredProcedure
3. Set the stored procedure name as the CommandText property
4. Add parameters to the Parameters collection as needed
5. Execute the command using the ExecuteNonQuery or ExecuteReader method

8. How would you update data in a database using ADO.NET?

1. Create a new DataAdapter object
2. Set the SelectCommand property to select the data from the database

3. Set the UpdateCommand property to update the data in the database
4. Use the DataAdapter.Update method to execute the update
